

## CLAIMS

1. A method for amortizing a critical path computations in a circuit comprising:

5 unrolling a data flow graph representing said circuit into a plurality of clock cycles; and  
simulating said circuit in said plurality of clock cycles on a computer.

2. The method of claim 1, wherein said step of simulating further comprises:  
reducing a difference between said critical path and a shortest path in said data flow

10 graph.

3. The method of claim 2, wherein said step of reducing further comprises:  
compacting one or more computations from said plurality of clock cycles in a processor.

15 4. The method of claim 2, wherein said step of unrolling further comprises:  
eliminating one or more flip-flops between one or more boundaries within said plurality  
of clock cycles.

20 5. The method of claim 2, wherein said step of unrolling further comprises:  
eliminating one or more latches between one or more boundaries within said plurality of  
clock cycles.

6. The method of claim 1, wherein said computer has a plurality of processors.

7. The method of claim 1, wherein said computer has a plurality of simulation processors, wherein said simulation processors include a communication network interconnecting said simulation processors for data communication, said simulation processors further including a synchronization network interconnecting said simulation processors for synchronizing execution therebetween.

8. The method of claim 1, wherein said step of simulating further comprises: delaying evaluation of one or more logic elements within said plurality of clock cycles, thereby creating a timing slack for inter-processor communication.

9. The method of claim 3, wherein said step of reducing further comprises: using a first processor wherein said processor computes said critical path and a non-critical path in a said plurality of clock cycles.

10. The method of claim 1, further comprising: compacting said plurality of clock cycles into a single clock cycle.

11. A critical path computation amortizer for a circuit comprising:  
a data flow graph unroller configured to represent said circuit into a plurality of clock cycles; and  
a simulator configured to simulate said circuit in said plurality of clock cycles on a computer.

12. The critical path computation amortizer of claim 11, wherein said simulator further comprises:

a reducer configured to reduce a difference between said critical path and said shortest path.

13. The critical path computation amortizer of claim 12, wherein said reducer further  
5 comprises:

a compactor configured to compact one or more computations from said plurality of clock cycles in a processor.

14. The critical path computation amortizer of claim 12, wherein said unroller  
10 further comprises:

an eliminator configured to eliminate one or more flip-flops at one or more boundaries within said plurality of clock cycles.

15. The critical path computation amortizer of claim 12, wherein said unroller  
15 further comprises:

an eliminator configured to eliminate one or more latches at one or more boundaries within said plurality of clock cycles.

16. The critical path computation amortizer 11, wherein said computer has a  
20 plurality of processors.

17. The critical path computation amortizer of claim 11, wherein said computer has a plurality of simulation processors, wherein said simulation processors include a communication network interconnecting said simulation processors for data communication, said simulation

processors further including a synchronization network interconnecting said simulation processors for synchronizing execution therebetween.

18. The critical path computation amortizer of claim 11, wherein said simulator is further configured to delay evaluation of one or more logic elements in said plurality of clock cycles, thereby creating a timing slack for inter-processor communication.

19. The critical path computation amortizer of claim 13, wherein said reducer further comprises:

10 a feed-back configured to use a first processor wherein, said first processor computes said critical path and a non-critical path in said plurality of clock cycles.

20. The critical path computation amortizer of claim 11, further comprising:  
a scheduling compactor configured to compact said plurality of clock cycles into a single clock cycle.

21. A computer program product comprising:  
a computer usable medium having computer readable program code embodied therein configured to amortize a critical path computation in a circuit, said computer program product comprising:

15 computer readable code configured to cause a computer to unroll a data flow graph representing said circuit into a plurality of clock cycles; and

computer readable code configured to cause a computer to simulate said circuit in said plurality of clock cycles on a computer.

22. The computer program product of claim 21, wherein said computer readable code configured to cause a computer to simulate further comprises:

computer readable code configured to cause a computer to reduce a difference between said critical path and said shortest path.

5

23. The computer program product of claim 22, wherein said computer readable code configured to cause a computer to reduce further comprises:

computer readable code configured to cause a computer to compact one or more computations from said plurality of clock cycles in a processor.

10

24. The computer program product of claim 12, wherein said computer readable code configured to cause a computer to unroll further comprises:

computer readable code configured to cause a computer to eliminate one or more flip-flops at one or more boundaries within said plurality of clock cycles.

15

25. The computer program product of claim 12, wherein said computer readable code configured to cause a computer to unroll further comprises:

computer readable code configured to cause a computer to eliminate one or more latches at one or more boundaries within said plurality of clock cycles.

20

26. The computer program product of claim 21, wherein said computer has a plurality of processors.

27. The computer program product of claim 21, wherein said computer has a plurality of simulation processors, wherein said simulation processors include a communication

25

network interconnecting said simulation processors for data communication, said simulation processors further including a synchronization network interconnecting said simulation processors for synchronizing execution therebetween.

5           28.     The computer program product of claim 21, wherein said computer readable code configured to cause a computer to simulate further comprises:

computer readable code configured to cause a computer to delay evaluation of one or more logic elements in said plurality of clock cycles, thereby creating a timing slack for inter-processor communication.

10           29.     The computer program product of claim 20, wherein said computer readable code configured to cause a computer to reduce further comprises:

computer readable code configured to cause a computer to use a first processor wherein said first processor computes said critical path and a non-critical path in said plurality of clock  
15 cycles.

30.     The computer program product of claim 21, further comprising:

computer readable code configured to cause a computer to compact said plurality of clock cycles into a single clock cycle.
